A Level Product Design Curriculum Intent 2021-2022

Core aims of the subject at Key Stage 5

At Brine Leas, we encourage students to use their creativity and imagination, to design and make products that solve real and relevant problems within a variety of contexts. We aim to, wherever possible, offer a breadth and depth of different disciplines and link with other subject areas such as Mathematics, Science, Engineering, Computing and Art which gives the learning purpose and relevance to the students. Our curriculum at Brine Leas strives to present a range of challenging opportunities for students to develop their creativity and imagination to design, to develop practical and technical skills as they design and make prototypes and products that solve real life design briefs, considering both their own and others' needs, wants and values. We deliver life skills through engineering skills, health and safety, teamwork, facilitated learning, confidence, workshop skills, Computer Aided Design and Computer Aided Manufacture, management skills and working independently. We have fantastic facilities with design and technology machinery that mirrors industry. We will encourage students to take risks in their design approaches and aim to develop resourceful, innovative and enterprising young learners who can go on to be the next generation of creative thinkers, designers and practitioners. This creative and thought-provoking qualification gives students the practical skills, theoretical knowledge and confidence to succeed in several careers and their future preparation. Especially those in the creative industries. They will investigate historical, social, cultural, environmental and economic influences on design and technology, whilst enjoying opportunities to put their learning in to practice by producing prototypes of their choice. Students will gain a real understanding of what it means to be a designer, alongside the knowledge and skills sought by higher education and employers.

Students will learn a range of life-long learning skills including to make decisions, consider sustainability and combine skills with understanding in order to design and make quality products, exploring ways in which aesthetics, technical, economic, environmental, economic, environmental, ethical and social dimensions interact to shape designing and making. Students will develop an understanding of why analysing existing products will help produce practical solutions to needs, wants and opportunities, recognising their impact on quality of life. By understanding the design process students can then design and make products which reflect and influence cultures and societies and that have an impact on lifestyle.

We also look at developing critical thinking and practical skills to resolve design situations. We take students through the process of the design & manufacture of products including model making skills, computer aided design and manufacture (CAD/CAM) which enables students to actively engage and take responsibility for their personal development in the process of design to develop as effective and independent learners.

Students will learn to make decisions, consider sustainability and combine skills with understanding in order to design and make quality products, exploring ways in which aesthetics, technical, economic, environmental, ethical and social dimensions interact to shape designing and making. Students will develop an understanding of why analysing existing products will help produce practical solutions to needs, wants and opportunities, recognising their impact on quality of life. By understanding the design process students can then design and make products which reflect and influence cultures and societies and that have an impact on lifestyle.

We are all in some small way creative, what this subject does is to foster and unleash that hidden talent by giving students the tools, skill and expertise to access it, and inspires and motivates them to do their best.

Community Involvement: Visiting speakers to discuss their business interest in Product Design, Photography and Graphics. Ex-students following either apprenticeships and/or university courses.

The A Level Product Design course places greater emphasis on understanding and applying iterative design processes. Students will use their creativity and imagination to design and make prototypes that solve real and relevant problem, consider their own and others' needs, wants and values.

The course is specification encourages students to be open to taking design risks, showing innovation and enterprise whilst considering their role as responsible designers and citizens. To develop intellectual curiosity about the design and manufacture of products and systems, and their impact on daily life and the wider world. To work collaboratively to develop and refine their ideas, responding to feedback from users, peers and expert practitioners. To gain an insight into the creative, engineering and/or manufacturing industries. To develop the capacity to think creatively, innovatively and critically through focused research and the exploration of design opportunities arising from the needs, wants and values of users and clients. To develop knowledge and experience of real world contexts for design and technological activity. To develop an indepth knowledge and understanding of materials, components and processes associated with the creation of products that can be tested and evaluated in use. To be able to make informed design decisions through an in-depth understanding of the management and development of taking a design through to a prototype/product. To be able to create and analyse a design concept and use a range of skills and knowledge from other subject areas, including maths and science, to inform decisions in design and the application or development of technology. To be able to work safely and skilfully to produce high-quality prototypes/products. To have a critical understanding of the wider influences on design and technology, including cultural, economic, environmental, historical and social factors. To develop the ability to draw on and apply a range of skills and knowledge from other subject areas, including the use of maths and science for analysis and informing decisions in design.

This is a design based course. The course combines theoretical content with practical application. The use of mathematical skills is a key requirement, and is tested in the examination. An understanding of underlying scientific principles is expected. An iterative approach to designing is encouraged. Various design strategies can be used. The acquisition of practical skills is still expected.

Trips and visits

Trip to IKEA to link the lighting project to a real business and real clients. Visiting a local design company, links with local companies and designers Visit to University's (Liverpool St John Mores, Glyn Dwr University and Stafford University

Assessment

Please see website for internal assessment record.

This specification is designed to be taken over two years.

This is a linear qualification. In order to achieve the award, students must complete all assessments at the end of the course and in the same series.

A-level exams and certification for this specification are only available in May/June 2019 and then every May/June for the life of the specification. All materials are available in English only.

Our A-level exams in Design and Technology: Product Design include questions that allow students to demonstrate their ability to:

- recall information
- draw together information from different areas of the specification
- apply their knowledge and understanding in practical and theoretical contexts.

Assessment criteria to include:

- Exploration
- Designing
- Development and CAD
- Making
- Analysis and evaluation.

The Non-exam assessment (NEA):

Students will develop intellectual curiosity about the design and manufacture of products. They will explore, design, create and evaluate innovative solutions in response to realistic design contexts. The NEA consists of a single design and make activity at A-level; students must identify and choose their own context making sure they have the opportunity to challenge themselves as a designer.

What's assessed:

Practical application of technical principles, designing and making principles.

How it's assessed:

- Substantial design and make project
- 100 marks
- 50% of A-level

Evidence:

Written or digital design portfolio and photographic evidence of final prototype.

The Exams:

Paper 1	Paper 2
What's assessed:	What's assessed:
	Designing and making principles
Technical principles	
	How it's assessed:
How it's assessed:	Written exam: 1 hour and 30 minutes
Written exam: 2 hours and 30 minutes	• 80 marks
• 120 marks	• 20% of A-level
• 30% of A-level	
	Questions:
Questions:	Mixture of short answer and extended response questions.
Mixture of short answer and extended response.	Section A:
	Product Analysis: 30 marks
	 Up to 6 short answer questions based on visual stimulus of
	product(s).
	Section B:
	Commercial manufacture: 50 marks
	 Mixture of short and extended response questions
	 Section B: Commercial manufacture: 50 marks Mixture of short and extended response questions

The exams and non-exam assessment will measure how students have achieved the following assessment objectives.

- AO1: Identify, investigate and outline design possibilities to address needs and wants.
- AO2: Design and make prototypes that are fit for purpose.
- AO3: Analyse and evaluate:
- design decisions and outcomes, including for prototypes made by themselves and others
- wider issues in design and technology.
- AO4: Demonstrate and apply knowledge and understanding of:
- Technical principles
- Designing and making principles.

Due to COVID the most up to date guidance is: we are still unclear of the Exam process moving forward, and waiting for guidance on this from AQA.

However the grading for the NEA has been tweaked to reflect practicalities- The making section and the evaluation section have both been reduced in marks.

Decision for 2022- Permit mock-ups and/or clear and detailed intentions of prototypes. Exam boards to provide clarification about their requirements. Permit demonstration of using machinery, tools and/or processes.

Homework

Specific homework will be set on a lesson-by-lesson, week by week basis. As the course requires theoretical knowledge and understanding there will be opportunity to embed learning via homework tasks.

As the course moves onto the NEA stages (including the practice NEA's) there will be a requirement for students to complete tasks for this to make sure they are meeting the deadlines set by the course.

Clubs and/or intervention

Catch up sessions offered at lunchtime and after school. Engineering enhancement club on a Friday after school. CAD clinics are also offered both on the timetable and in extra-curricular sessions,

Intervention will take place if a student misses deadlines or is not engaging with the require effort or quality of work to satisfy their target grade. This will be tracked and communicated with parents/carers via Data Collection points, parent's evenings, phone call/email/letter correspondence.

Parental/Carer support

Parents are asked to support their child through this course, they should be encouraged to meet external deadlines and those set by the members of staff.

Helpful sources of information

Details of the course and support information, exemplar material and lesson content can be found on 'Teams' Specification can be found on:

Students should develop their ability to		
work with a variety of materials,		
forme, to produce creative and original		
ionns, to produce creative and original		
domands of the target market and		
appender appurate and officient		
consider accurate and enicient		

When designing products Students should consider aesthetics, ergonomics and anthropometrics. Inclusive design Students should be aware of, and be able to explain, the development of products that are inclusive in their design so that they can be used by a wide range of users including the disabled, children and the elderly.	
---	--

Year 13 Overview

Term	Knowledge	Assessment	Connections
			to learning
	Big Idea: Continuation: Big Idea: This is the exciting part! The fe of the course to complete. Applying the skills and knowledge p preparation for examinations, apprenticeship or university appl format as the previous two design activities. Students are encouraged to set themselves a challenging and r master in the area they have chosen. It will allow further in dept examined on either paper 1 or 2. Rationale: The NEA is compulsory element of the course which is w assessed against the specification criteria. It will inform teachers and the practise NEA there will be continued teaching of the Theoretical	ormulation of a design task, whi reviously gained as well as deve ication. This design task follows igorous bespoke project. The st in knowledge and skills to be de orth 50% of the final grade. The w d help make decisions on UCAS p aspects of the specification	ich will take the remainder eloping a new skill set and s the same tudent should become the eveloped which could be ork produced will be redicted grades. Alongside
Autumn 1	 NEA Virtual modelling simulation > computational fluid dynamics (CFD) as used for testing aerodynamics and wind resistance, and flow of liquids within/around products > finite element analysis (FEA) as used in component stress analysis. Rapid prototyping processes Students should be aware of, and be able to describe, rapid prototyping processes, including 3D printing. Students should understand, and be able to explain, the benefits to designers and manufacturers. Electronic data interchange the use of electronic point of sales (EPOS) for marketing purposes and the collection of market research data, including: > the maintenance of stock levels 	Students must produce a final prototype based on the design brief that they have developed. Students should produce a concise folder. It is recommended that this folder should not exceed 45 pages. Students who do not follow these guidelines will penalise themselves by not meeting the expectations of the assessment appropriately. Students that exceed the recommended length will self- penalise by not being appropriately.	 Future learning Links to syllabus/ specification for exam/ revision Prior knowledge and skills from the pizza and lighting project (Practice NEA)

	 the capture of customer data e.g. contact details. Production, planning and control (PPC) networking availability of materials scheduling of machines and people coordinating suppliers and customers. Ease of manufacture ribs and webbing to reduce material thicknesses snap fittings to remove the need for fixings/ adhesives internal moulded screw posts for use with self-tapping screws use of pre made components use of standardised patterns and sizes addition of texture in moulding to reduce number of manufacturing processes self-finishing. Disassembly Students should be aware of, and able to explain, how a product can be designed and manufactured with disassembly in mind, including integral fixings and active disassembly using smart materials such as SMA and biodegradable parts. 	focused on the demands of the task. Students that produce work that is shorter than the recommended page count will self-penalise by not allowing appropriate coverage of the assessment objectives.	
Autumn 2	Big Idea: Continuation: Big Idea: This is the exciting part! The feethe course to complete. Applying the skills and knowledge preverse preparation for examinations, apprenticeship or university apple previous two design activities. Students are encouraged to set themselves a challenging and remaster in the area they have chosen. It will allow further in depter examined on either paper 1 or 2. Rationale: The NEA is compulsory element of the course, which is we assessed against the specification criteria. It will inform teachers and the practise NEA there will be continued teaching of the Theoretical	ormulation of a design task, which riously gained as well as develop ication. This design task follows igorous bespoke project. The stu h knowledge and skills to be dev worth 50% of the final grade. The we d help make decisions on UCAS pr aspects of the specification	ch will take the remainder of ing a new skill set and the same format as the udent should become the reloped which could be ork produced will be edicted grades. Alongside

urea formaldehyde (UF)		
melamine formaldehyde (MF)		
polyester resin		
 epoxy resin. 		

Elastomers	
Ability to be stretched and then return to original shape	
• texture	
• self-finishing	
•non-toxic.	
Students should understand how elastomers are used to enhance	
products, for example in producing grips for improved ergonomics.	
Be familiar with the following elastomers	
natural rubber	
 polybutadiene 	
• neoprene	
• silicone	
 Thermoplastic Elastomer (TPE). 	
Biodegradable polymers	
Ability to be moulded into 3D products or film	
Ability to degrade with the action of UV rays (sunlight), water or	
enzymes present in soil.	
Students should understand now biodegradable polymers degrade.	
Corn starch polymers;	
• potatopak	
• Diopoi (bio-batch additive)	
• polyactide (PLA)	
• polyndroxyalkanoate (PHA)	
• water soluble: lactide, glycolide (Lactel and ecofilm).	
Composites	
Ability to be moulded into a variety of 3D forms	
Enhancement of physical and/or	
mechanical properties	
> ease of manufacture for some uses against traditional materials	
improved product performance.	
Students should be familiar with the following composites:	
carbon fibre reinforced plastic (CFRP)	
glass reinforced plastic (GRP)	
tungsten carbide	
aluminium composite board	
concrete, including reinforced concrete	

	➢ fibre cement			
	engineered wood, e.g. glulam (glued			
	laminated timber).			
	Big Idea: Continuation: Big Idea: This is the exciting part! The for	ormulation of a design task, whic	ch will take the remainder	
	of the course to complete. Applying the skills and knowledge pr	eviously gained as well as devel	oping a new skill set and	
	preparation for examinations, apprenticeship or university appli	cation. This design task follows	the same format as the	
	previous two design activities.			
	Students are encouraged to set themselves a challenging and ri	gorous bespoke project. The stu	Ident should become the	
	master in the area they have chosen. It will allow further in dept	h knowledge and skills to be dev	eloped which could be	
	examined on either paper 1 or 2.			
	Rationale: The NEA is compulsory element of the course, which is worth 50% of the final grade. The work produced will be			
	assessed against the specification criteria. It will inform teachers and	help make decisions on UCAS pr	edicted grades. Alongside	
	the practise NEA there will be continued teaching of the Theoretical	aspects of the specification.		
	NEA Health and safety	Students must produce a final	Future learning

replacement of parts	assessment objectives.	
ability to upgrade with software downloads	,	
Feasibility studies		
Students should be aware of and able to explain the use of		
foosibility studios to oppose the practicality for production of		
reasoning studies to assess the practicality for production of		
proposed designs, including the testing of prototypes with potential		
consumers.		
Enternaise and medication in the development of preducts		
Enterprise and marketing in the development of products		
• labelling		
• packaging		
 corporate identification 		
 concept of global marketing: 		
 the promotion and advertisement of 		
products including the use of new		
technologies, e.g. social media, viral marketing		
product costing and profit		
• awareness of the role of entrepreneurs.		
Students should be aware of and able to explain the collaborative		
working of designers in the development of new and innovative		
products including virtual and face-to-face collaborative working		
systems.		
Design communication		
roport writing		
the use of graphs		
• the use of graphs		
• tables and charts		
• 2U/3U SKETCHING		
the use of mixed media and rendering to		
enhance drawings		
dimensioning and details for manufacture.		

Charles and Ray Eames	
Marianne Brandt.	
Socio economic influences	
Post WW1: the Bauhaus and	
development of furniture for mass production	
WW2: rationing, the development of 'utility' products	
Contemporary times: fashion and demand for mass produced	
furniture	
Decorative design.	
Major developments in technology	
Micro electronics	
new materials	
 new methods of manufacture 	
 advancements in CAD/CAM. 	
Social, moral and ethical issues	
Products are made using sustainable	
materials and ethical production methods	
The development of products that are:	
culturally acceptable	
 not offensive to people of different race, gender or religious 	
belief	
the development	
of products that are inclusive	
 the design and manufacture of products that could assist with 	
social problems e.g.poverty, health and wellbeing, migration	
and housing	
 the impact of Fairtrade on design and 	
consumer demand	
designing products	
Product life cycle	
Design introduction, evolution, growth, maturity, decline and	
replacement.	
Students should be familiar with examples of how designers refine	
and re-develop products in the lifecycle of specific products.	
The use of a design process	
Those used in the NEA	
 investigations and analysis 	
 use of inspiration materials, e.g. mood boards 	
ideas generation	

• illustration	
• IIIUSUAUOI	
• planning	
• evaluating and testing.	
Prototype development	
Students should be aware of, and able to discuss and demonstrate,	
the development of a	
prototype from design proposals.	
I his knowledge should influence the	
development of design ideas for the NEA so that students may	
make high quality products that meet the needs of identified users.	
The iterative design process in industrial or commercial	
contexts	
Students should be aware of, and able to discuss, how different	
design methodologies	
are used by designers in the corporate world when designing	
products including collaborative working and the cyclic nature of	
commercial design and manufacture.	
Critical analysis and evaluation	
Students should be aware of, and able to discuss, their own and	
commercial products leading to possible improvements/	
modifications of the original idea.	
Testing and evaluating products in commercial products	
Students should be aware of, and able to discuss, how products are	
required to undergo rigorous testing, and the testing methods used,	
before they become commercially available for sale.	
Use of third party feedback in the testing and evaluation	
process	
Students should be aware of, and able to discuss, how the use of	
feedback and testing informs the evaluation process, including:	
Informing future modification and	
development	
• the importance of ensuring the views of other interested parties	
in order to have	
objective and unbiased feedback.	
Selecting appropriate tools, equipment and processes	
the importance of using the correct tools and equipment for specific	
tasks	

 the importance of ensuring their own safety and that of others 	
when in a	
workshop situation	
 how designs are developed from a single prototype into mass 	
produced products	
 the effect on the manufacturing process that is brought about by 	
the need for	
batch and mass manufacture	
 how to select the most appropriate 	
manufacturing process to be able to realise there, or others',	
design proposals	
 the importance of health and safety in a 	
commercial setting including workforce	
training and national safety standards.	
Accuracy in design and manufacture	
Students should be aware of, and able to discuss and demonstrate,	
the importance of	
accuracy in manufacturing, whatever the scale of production,	
including:	
 how testing can eliminate errors 	
 the value in the use of measuring aids, e.g. 	
templates, jigs and fixtures in ensuring	
consistency of accuracy and the reduction	
of possible human error.	
Responsible design	
Environmental issues	
Students should be aware of, and able to discuss, the importance	
environmental issues in design and manufacture, including:	
 the responsibilities of designers and 	
manufacturers in ensuring products are made from sustainable	
materials and	
components	
• the environmental impact of packaging of	
products, e.g. the use of excessive	
packaging and plastics.	
Students should be swore of and able to discuss the concent of a	
Situdents should be aware of, and able to discuss, the concept of a	
circular economy, including.	
The products are designed to conserve	

energy, materials and components	
 the design of products for minimum 	
impact on the environment including raw	
material extraction, consumption, ease of repair, maintenance and	
end of life	
 sustainable manufacturing including the 	
use of alternative energy and methods to	
minimise waste	
 the impact of waste, surplus and by products created in the 	
process of	
manufacture including reuse of material off-cuts, chemicals, heat	
and water	
 cost implications of dealing with waste 	
 the impact of global manufacturing on 	
product miles.	
Planning for accuracy and efficiency	
Students should be aware of, and able to discuss and demonstrate,	
the importance of	
planning for accuracy when making prototypes and making	
recommendations for small, medium and large scale production.	
Quality assurance	
Students should be aware of, and able to discuss and demonstrate,	
the procedures and policies put in place to reduce waste and ensure	
manufactured products are produced accurately and within	
acceptable tolerances, including quality assurance systems	
including Total Quality Management (TQM), scrum, Six	
Sigma and their applications to specific industrial examples	
including critical path analysis.	
Quality control	
Students should be aware of, and able to discuss and demonstrate,	
quality control, including:	
• the monitoring, checking and testing of	
materials, components, equipment and	
products throughout production to ensure they conform to	
acceptable tolerances	
• specific quality control methods including the use of 'go-no go'	
gauges, laser or	
probe scanning and measuring	
 use of digital measuring devices such as 	

vernier callipers and micrometers	
 non-destructive testing such as x-rays and ultrasound. 	
National and international standards in product design	
British Standards Institute (BSI)	
International Organisation for	
Standardisation (ISO)	
Restriction of Hazardous Substances	
 (ROHS) directive 	
battery directive	
polymer codes for identification and recycling	
packaging directives	
WEEE directives	
energy ratings of products	
eco-labelling:	
the Mobius Loop	
the European Eco-label	
NAPM recycled mark	
the EC energy label	
the Energy Efficient label and logo	
Forest Stewardship Council (FSC)	
EPA energy star.
